1. Title

CareOS

An Emergency-First AI Health Companion for Indian Families

2.The Problem

Health information is everywhere, but nowhere at once.

- Prescriptions in one drawer, lab reports in a PDF, symptoms only in memory
- Hard to know if a symptom is urgent or something to just watch
- Doctor visits are short — patients forget to mention recent history
- Families managing elderly parents or kids have no shared health view

3. Our Solution: CareOS

One care workspace per family member, powered by AI agents.

- Chat with CareOS about any symptom, in English or Hindi
- Upload lab reports — CareOS reads and explains them
- Track medications and get interaction checks
- Every family member gets their own private, isolated health profile
- Built-in emergency detection that runs before anything else

Every message goes through an emergency check first, then to the right specialist.

- Emergency Detector (Groq) — checks for red-flag symptoms instantly
- Orchestrator (Gemini) — decides which specialist agent should respond
- Symptom Analyst, Report Reader, Medication Manager, Care Coordinator — each handles their own job
- All results are saved to a shared health timeline

5. Emergency-First Safety Net

Speed matters when someone might be in danger.

- Every single chat message is scanned for emergency symptoms first
- If detected: full-screen red alert + "Call 112" button, instantly
- If not an emergency: message continues to the normal care agents
- Emergency check uses a fast model (Groq) so there's no lag

6. Beyond Chat: Daily Insights & Timeline

CareOS doesn't just react — it proactively helps.

- Speaks a personalized greeting when you open the app
- Daily Plan: actionable suggestions (medicine reminders, follow-ups, report reviews)
- Insight cards: latest concern, what to avoid/do, quick summary
- Structured Profile Timeline: symptoms, medications, and reports in one scrollable view
- Follows up automatically on unresolved symptoms in later conversations

7. Trust & Data Control

Health data is sensitive — so we made "delete" a real, visible feature.

- Every record (symptom, report, medicine) can be archived, restored, or deleted
 - A single Data Control tab shows exactly what's active, archived, or deleted
 - Every action is logged in an audit trail — nothing disappears silently
 - "AI Context Transparency" shows exactly what data fed each chat reply
 - One-click guided demo shows the full archive → restore → delete flow
- 

8. Tech Stack

Built for speed, accuracy, and real deployment.

Layer Tech

Frontend : Next.js, React, TypeScript, Tailwind

Backend : FastAPI (Python)

AI Brain : Google Gemini Flash (reasoning + PDFs + memory)

Emergency Layer : Groq Llama 3.1 8B (fast detection)

Memory : ChromaDB (semantic search)

Database : Supabase (Postgres + Storage + Auth)

Voice : gTTS (Hindi/English) + Web Speech API

10.Demo & What's Next

Try it live: symptom check → emergency alert → report upload → family switch → data control.

What's next before real users:

- Row-level security & encryption
- Emergency contact notifications
- Clinical review & regulatory compliance
- SMS/push medication reminders

Thank you
